Forecast for Friday 26 Feb 2021

Weather: A dry day with long sunny spells, but some lower level cloud for a time this morning over southern and western foothills, and again later this evening.

Chance of cloud free mountain/hill tops above 800m: 95%, very little cloud above 800m

Visibility: The clarity of the air will be good, especially on the tops, but there will be poor visibility where lower cloud at 300-600m intersects the hills.

**Level above which ground is expected to be frozen/snow is expected to settle.*

Meteorologist's View

Feeling cool at height with freezing level around the fell tops.

Forecast for Saturday 27 Feb 2021

Weather: Some light and patchy rain will move into the Lake district overnight and will be slow to clear on Saturday but it should become drier during the afternoon.

Maximum wind: Southwesterly 10-15mph

Chance of cloud free mountain/hill tops above 800m: 30% in the morning but increasing to 60% in the afternoon with some cloud lifting and clearing as rain moves away east.

Visibility: Visibility will be poor in the morning with cloud bases extensive from 500m and above due to the area of patchy rain and drizzle affecting the area. Perhaps cloud will be more scattered around the northern Fells and bases may be around 6-700m here. Cloud breaking and lifting in the afternoon with just a few patches around 600m and main bases rising to around 800m, again the best conditions will be in the north of the park.

Temperature: **Valleys:** Plus 3 rising to 9 Celsius.
At 800m: Plus 1 rising to plus 4 Celsius.
Freezing level: 1000m falling to 800m and then rising to 1200m later in the evening.

Mountain Weather Forecast

Ground Conditions Supplement

Date: Thursday 25 February 2021 Location: Lower Man summit at 11:00 Full report: Here is today's report: A dull start to the day with light showers and hill fog gave way to dry and clear conditions in the afternoon. The ground is still very wet and many rivers are in spate following heavy rain earlier in the week. Although the Cumbrian fells are relatively snow-free, what snow remains needs to be negotiated carefully as it tends to be found on steep ground around north and east-facing corrie headwalls. The summit temperature was around freezing point today, and these areas of snow have become firm and icy, especially where it has been compacted by walkers' feet. The final section of Swirral edge has an area of unavoidable snow, from where a slip could result in a long and damaging fall. Microspikes/Crampons may be required to negotiate this and similar areas safely. Small patches of ice are also still present on the summit plateau and are proving very resistant to the milder temperatures. As a result of the ground being well frozen earlier in the month and subsequently having thawed out in most areas, it is now very soft and prone to erosional damage in places. Temperature: minus 0.2 C, Maximum wind speed 27 mph, Wind chill: minus 8.4 C, Average wind speed: 22.5mph
